Storm in a European teacup

Markets ploughed ahead in July, showing surprising resilience to the macro tremors felt in June. Buoyed by expectations of a rate hike in H216, value factors strongly outperformed as the quality trade took a back seat once again.

Value increases its lead

While defensive value factors crept ahead in June, July was dominated by cyclical deep-value factors, symptomatic of aggressive investor positioning; names trading cheaply on P/E, EV/EBIT and P/BV all performed well. Even the most-sought-after factor of 2016 YTD, low volatility, stumbled amid the rush for cyclical upside amidst stubbornly low volumes.

Beware the pain trade

The same cyclical factors that strongly outperformed in July are all indicating significant crowding, according to our crowding barometer; beware the large-cap, low-beta names trading cheaply on P/E and P/BV. Greater China and Singapore appear to have been crowdedly sold off; Asia ex-Japan utilities, telecoms, consumer staples and information technology are crowded buys.

¹ Note for all tables and charts: Data as of 31 July 2016. Style portfolios are formed by assigning stocks in a representative index into high, medium or low baskets according to a factor. These portfolios are free-float market capitalisation-weighted and rebalanced monthly. Factor returns are calculated as the difference of relevant style portfolios returns (typically high minus low or low minus high if indicated by an asterisk (*)). For further details, please see Appendix: Description of factors.

Factor performance charts

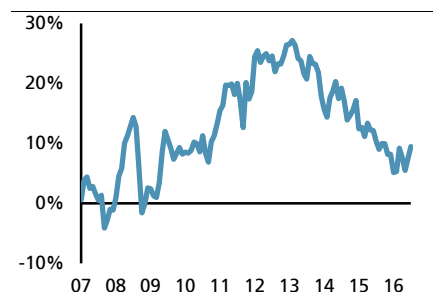

Figures 11-22 show the cumulative returns of selected factors often used by investors in stock screens and factor models and provide a visual representation of the recent effectiveness of different factors. A positive slope suggests that a factor has been effective at distinguishing between outperformers and underperformers.

Appendix

Description of factors

Style portfolios are formed by ranking relevant MSCI (for GEM and Asia ex-Japan), Russell 3000 (for the US), Dow Jones (for Europe and Japan) and S&P (for Australia) index constituents by respective factors. Stocks are assigned to high, medium or low baskets based on the style value in relation to its peer group, which are based on region and size. Style portfolios are free-float market capitalisation-weighted and rebalanced on monthly basis.

Factor returns are calculated as the difference of relevant style portfolios returns (typically high minus low, or low minus high if indicated by an asterisk (*)). We calculated the factors in the direction that we thought was the most intuitive. For example, institutional investors typically prefer cheaper stocks to more expensive stocks, so we calculate the Book to Price factor as high minus low. On the other hand, we think most investors tend to prefer less volatile stocks to more volatile stocks, and so compute the Volatility factor as low minus high.
