

Quantessentials

R advice – Rollin' Rollin' Rollin'

Calculating rolling means and other statistics

Resisting the temptation to call out "Rawhide!" this month's addition to the Quantessentials series looks at the various implementations of a simple and common operation – calculating rolling means and other statistics from time series. There are a few packages which offer this functionality and we highlight the ones that we prefer and those that we find less attractive.

Turning ggplots interactive

ggplot2 is a great graphics library but sometimes adding in a little bit of interactivity for inclusion in a web page (or Shiny application) in our view would improve things a bit. The ggiraph package makes this very straightforward. We give a simple example.

Calculating rolling statistics

A very common operation that we all need to do is calculate various statistics over rolling windows along data. These could be univariate operations (e.g. moving averages, rolling standard deviations) or multivariate (e.g. rolling correlations).

As is common in R there are a number of packages which offer functions to do this. In this note we will compare them¹ for both speed and convenience.

The list of packages we will investigate is

- [caTools](#)
- [RcppRoll](#)
- [roll](#)
- [TTR](#)
- [zoo](#)

We can also (at least for some of the operations) use the *filter* function from the *stats* rather than the *dplyr* package.

There is also the [rollply](#) package which does allow rolling window calculations but in our view is not in a very convenient form.

We look at two very basic operations – rolling means and rolling correlations – in order to capture the efficiency of all the packages on a univariate and a multivariate calculation. For rolling means we analyse the calculation on both a single time series and a matrix of time series.

The *roll* package is interesting as it uses the [RcppParallel](#) package to implement its various functions. This means that it can use all the cores on your machine in order to speed up its calculations. The downside of this is if you use all the cores it does make doing anything else on the machine basically impossible.

Rolling means on a single time series

The first example we will run is looking at calculating a simple moving average on a single time series.

For this simple case, as can be seen in Figure 1 below, the *RcppRoll* package seems the quickest but there is little between *caTools*, *RcppRoll* and *roll*. The main message from this analysis is to avoid the *zoo* rolling mean function.

¹ We have attempted to find all the packages which offer this functionality, but it is quite possible that we have missed some.

Figure 1: Calculating a simple moving average

```
require (caTools)
require (RcppRoll)
require (roll)
require (TTR)
require (zoo)

require (microbenchmark)
require (RcppParallel)

x <- runif(1e5)
k <- 50

x1 <- caTools::runmean(x, k, align='right', endrule='NA')
x2 <- RcppRoll::roll_mean(x, k, fill=NA, align='right')
x3 <- drop(roll::roll_mean(as.matrix(x), k))
x4 <- TTR::SMA (x, k)
x5 <- zoo::rollmean(x, k, align='right', na.pad=T)
x6 <- stats::filter (x, rep (1/k, k), sides= 1, circular = FALSE)@.Data

all.equal(x1, x2)
[1] TRUE
all.equal(x1, x3)
[1] TRUE
all.equal(x1, x4)
[1] TRUE
all.equal(x1, x5)
[1] TRUE
all.equal(x1, x6)
[1] TRUE

microbenchmark(caTools::runmean(x, k, align='right', endrule='NA'),
  RcppRoll::roll_mean(x, k, fill=NA, align='right'),
  drop (roll::roll_mean(as.matrix(x), k)),
  TTR::SMA (x, k),
  zoo::rollmean(x, k, align='right', na.pad=T),
  stats::filter (x, rep (1/k, k), sides= 1, circular = FALSE)@.Data)

Unit: milliseconds
      expr      min       lq      mean     median      uq      max neval  cld
caTools::runmean  2.625196  2.970995  5.381337  3.210291  4.750618  42.22544   100 ab
RcppRoll::roll_mean  2.657341  2.845263  3.415133  2.939299  3.152158  35.00600   100 a
roll::roll_mean    3.041597  3.324606  4.964298  3.511627  4.390847  39.702089   100 ab
TTR::SMA          3.150054  3.525747  7.130375  5.206827  5.807996  45.99679   100 b
zoo::rollmean     107.517016 110.611339 120.639898 112.835003 127.388942 164.60013   100 d
stats::filter     14.157064 14.829437 17.672127 16.079693 17.013444  55.16454   100 c
```

Source: UBS. Analysis run in the standard implementation of R.

There are two things to note in the code. The first is for the *roll* package the *x* variable has to be converted to a matrix and in order to return a vector one has to convert it back via the *drop* function². Also the *filter* function returns an object of the *ts* class.

In the example above we showed the checks that all the functions returned the same answer. We ran this for the other examples below and as they all passed we don't report it.

² One could also use the matrix extraction [, 1] but this is consistently slower than drop.

When running the same analysis in Microsoft R Open all the timings were (probably surprisingly) slower except for *filter*. On our Linux machine the results were similar but the *roll* function just beat the others.

The forecast package contains an *ma* function but it only creates centred moving averages and so is awkward to use in financial situations where one wants the moving average to be aligned to the right.

Figure 2: Example of ma in the forecast package

```
require (forecast)

x <- 1:10
forecast::ma (x, 5)
[1] NA NA 3 4 5 6 7 8 NA NA
```

Source: UBS

Rolling means on a matrix

The second test we carried out was calculating the rolling means for a matrix. For this test we dropped the *zoo* and *filter* functions for being too slow.

Figure 3: Calculating the rolling means of a matrix (Windows)

```
x <- matrix (runif(1e6), ncol = 100)
k <- 50

microbenchmark(caTools::runmean(x, k, align='right', endrule='NA'),
  RcppRoll::roll_mean(x, k, fill=NA, align='right'),
  roll::roll_mean(x, k),
  apply (x, 2, TTR::SMA, n = k))

Unit: milliseconds
      expr      min       lq     mean  median      uq      max neval   cld
caTools::runmean 17.79262 19.70894 22.71246 20.41766 22.33714 55.11166  100  a
RcppRoll::roll_mean 29.22925 30.70784 32.91910 31.76747 33.10816 65.91198  100  d
roll::roll_mean 22.51575 23.09423 24.71792 23.80792 25.31474 57.23273  100 ab
apply(TTR::SMA) 53.65456 56.47564 61.51094 58.09603 61.65903 97.25929  100  e
```

Source: UBS

The results we achieved are similar to those above. The *caTools* package is just the quickest but the function in the *roll* package is comparable. *RcppRoll*, the quickest in the univariate case, is now around 33% slower than the fastest options.

As we mentioned above, the *roll* package uses the *RcppParallel* package to speed up some calculations. On our test machine the default number of threads was 8, but reducing this to 4 made little difference to the speed. Dropping the number of cores to 1 however increased the times for the *roll::roll_mean* function by around a factor of 4.

roll is slow if it can't use all the cores of the machine

On our Linux machine (which has 20 cores) the benefit to using the parallel enabled *roll* came through much more, as can be seen in Figure 4 below. The *roll* function beat *caTools* by around a factor of two.

Figure 4: Calculating the rolling means of a matrix (Linux)

Unit: milliseconds

	expr	min	lq	mean	median	uq	max	neval	cld
caTools::runmean		36.51636	40.20384	54.63619	41.78244	45.62528	169.4807	100	b
RcppRoll::roll_mean		39.79583	41.43693	49.71411	43.21604	44.18452	152.0087	100	b
roll::roll_mean		14.20528	15.60131	18.75688	16.41521	17.59046	122.9053	100	a
apply(TTR::SMA)		86.52237	91.13151	106.89582	93.00480	97.44380	301.6138	100	c

Source: UBS

Rolling correlations

The conclusion from our final test, calculating a rolling correlation matrix, is a very simple one as only the *roll* package offers this functionality. However there is an option in the package for whether the operations are run in parallel by rows or columns.

Figure 5: Calculating rolling correlations

```
x <- matrix (runif(1e6), ncol = 100)
k <- 50
```

```
res <- microbenchmark(roll::roll_cor (x, k, parallel_for = "rows"),
  roll::roll_cor (x, k, parallel_for = "cols"), times = 10)
```

Unit: seconds

	expr	min	lq	mean	median	uq	max	neval	cld
roll_cor(x, k, parallel_for = "rows")		18.73922	18.80316	18.86287	18.85362	18.91406	18.99667	10	a
roll_cor(x, k, parallel_for = "cols")		21.85780	21.94201	22.19310	22.19057	22.45358	22.59075	10	b

Source: UBS

We see that the default option, rows, is consistently quicker. Do note that the units for the time in this case are seconds rather than the milliseconds in the other examples.

Conclusion

Based on this analysis, the choice seems to come down to a two way tie on Windows. *caTools* is marginally quicker for most single variable operations, but the *roll* package is a very close second and has the advantage of being able to calculate rolling correlation- and covariance matrices.

caTools and *roll* are most preferred ...

The least preferred choice which seems very clear is not to use the functions from the *zoo* package. These functions are the only ones written just in R – all the others use either C or Rcpp to speed up the calculations.

... and *zoo* is least preferred

Making interactive plots from ggplot

There is a useful package which has recently turned up on cran. This is called [ggiraph](#). It is a way of turning [ggplot](#) charts into interactive ones.

For example, let's suppose we have run a backtest³ where we have separated our data into 10 deciles and calculated their performance. As an example:

Figure 6: Plotting the results from a backtest

```
require (ggplot2)
require (reshape2)
require (lubridate)

head (res$index)

      1      2      3      4      5      6      7      8      9     10     BM
1928-12-31 100.0000 100.0000 100.00000 100.00000 100.0000 100.0000 100.00000 100.00000 100.0000 100.0000 100.00000
1929-01-02 101.2988 101.2782 101.50666 101.12464 101.6292 102.4313 101.61263 102.71568 101.4855 100.8295 101.59274
1929-01-03 101.4897 101.7485 101.79646 101.36420 101.7696 102.7129 101.50452 102.20886 101.9097 101.8416 101.83305
1929-01-04 101.8353 101.4698 101.83368 101.22549 102.0951 102.6396 101.41820 101.95304 102.0261 102.1575 101.86504
1929-01-05 101.6046 101.1697 101.54181 100.46877 101.0026 101.6976 100.27906 100.77526 102.0891 101.5164 101.21179
1929-01-07 100.4996 100.2130 99.96206 99.23583 99.0019 99.9472 98.87468 98.77548 101.2601 100.3144 99.80419

# Convert into long format
index.df = melt (res$index)

# Convert to a date
index.df$dt = ymd (index.df$Var1)

# Plot the chart
ggplot (index.df, aes (x = dt, y = value, group = Var2, color = Var2)) + geom_line() +
  scale_y_log10()
```

Source: UBS

³ The data is taken from our recent note [Do low-volatility stocks have interest rate risk?](#)

The problem comes in identifying which line is which. A similar problem can occur with a scatter plot – which point is which. A simple change to the code to use the ggiraph package solves this.

Figure 7: Example of the ggiraph interactive chart

```
h <- ggplot (index.df, aes (x = dt, y = value, group = Var2, tooltip = Var2, color = Var2)) +  
  geom_line_interactive() + scale_y_log10()  
  
ggiraph(code = {print(h)})
```

Source: UBS

The only changes are replacing `geom_line ()` with `geom_line_interactive ()` and adding a `tooltip` option in the `aes ()` function. The charts can be put into a Shiny application. If you hover over one of the lines with your mouse then the text in the `tooltip` variable appears. There are many other libraries which produce interactive graphics (all using JavaScript, we believe) which we intend to investigate in a future note.

Appendix

R environment

We used two versions of R in our tests. Both are based on R version 3.3.1. The first is the standard implementation from cran; the second is the Microsoft R Open version which calls the Intel MKL library and hence parallelises various operations. Both are running on an Intel i7-6700 running at 3.4GHz.

Our Linux machine is a virtual machine with 20 CPUs / cores running at 2.5GHz.

We show below the version numbers of the packages we compared.

Figure 8: Package versions tested

Package	Version	Package	Version
caTools	1.71.1	roll	1.0.6
forecast	6.1	rollply	0.5.0
RcppParallel	4.3.30	TTR	0.23.1
RcppRoll	0.2.2	zoo	1.0.6

UBS Securities Co. Limited is licensed to conduct securities investment consultancy businesses by the China Securities Regulatory Commission. UBS acts or may act as principal in the debt securities (or in related derivatives) that may be the subject of this report. This recommendation was finalized on: 20 October 2016 11:09 AM GMT.

Analyst Certification: Each research analyst primarily responsible for the content of this research report, in whole or in part, certifies that with respect to each security or issuer that the analyst covered in this report: (1) all of the views expressed accurately reflect his or her personal views about those securities or issuers and were prepared in an independent manner, including with respect to UBS, and (2) no part of his or her compensation was, is, or will be, directly or indirectly, related to the specific recommendations or views expressed by that research analyst in the research report.

UBS Investment Research: Global Equity Rating Definitions

12-Month Rating	Definition	Coverage ¹	IB Services ²
Buy	FSR is > 6% above the MRA.	45%	28%
Neutral	FSR is between -6% and 6% of the MRA.	39%	25%
Sell	FSR is > 6% below the MRA.	15%	17%
Short-Term Rating	Definition	Coverage ³	IB Services ⁴
Buy	Stock price expected to rise within three months from the time the rating was assigned because of a specific catalyst or event.	<1%	<1%
Sell	Stock price expected to fall within three months from the time the rating was assigned because of a specific catalyst or event.	<1%	<1%

Source: UBS. Rating allocations are as of 30 September 2016.

1: Percentage of companies under coverage globally within the 12-month rating category.

2: Percentage of companies within the 12-month rating category for which investment banking (IB) services were provided within the past 12 months.

3: Percentage of companies under coverage globally within the Short-Term rating category.

4: Percentage of companies within the Short-Term rating category for which investment banking (IB) services were provided within the past 12 months.

KEY DEFINITIONS: **Forecast Stock Return (FSR)** is defined as expected percentage price appreciation plus gross dividend yield over the next 12 months. **Market Return Assumption (MRA)** is defined as the one-year local market interest rate plus 5% (a proxy for, and not a forecast of, the equity risk premium). **Under Review (UR)** Stocks may be flagged as UR by the analyst, indicating that the stock's price target and/or rating are subject to possible change in the near term, usually in response to an event that may affect the investment case or valuation. **Short-Term Ratings** reflect the expected near-term (up to three months) performance of the stock and do not reflect any change in the fundamental view or investment case. **Equity Price Targets** have an investment horizon of 12 months.

EXCEPTIONS AND SPECIAL CASES: **UK and European Investment Fund ratings and definitions are:** **Buy:** Positive on factors such as structure, management, performance record, discount; **Neutral:** Neutral on factors such as structure, management, performance record, discount; **Sell:** Negative on factors such as structure, management, performance record, discount. **Core Banding Exceptions (CBE):** Exceptions to the standard +/-6% bands may be granted by the Investment Review Committee (IRC). Factors considered by the IRC include the stock's volatility and the credit spread of the respective company's debt. As a result, stocks deemed to be very high or low risk may be subject to higher or lower bands as they relate to the rating. When such exceptions apply, they will be identified in the Company Disclosures table in the relevant research piece.

When you receive Global Research via a third party vendor, e-mail or other electronic means, your use shall be subject to this Global Research Disclaimer and to UBS's Terms of Use/Disclaimer (<http://www.ubs.com/global/en/legalinfo2/disclaimer.html>). By accessing and/or using Global Research in this manner, you are indicating that you have read and agree to be bound by our Terms of Use/Disclaimer. In addition, you consent to UBS processing your personal data and using cookies in accordance with our Privacy Statement (<http://www.ubs.com/global/en/legalinfo2/privacy.html>) and cookie notice (<http://www.ubs.com/global/en/homepage/cookies/cookie-management.html>).

If you receive Global Research, whether through a System or by any other means, you agree that you shall not copy, revise, amend, create a derivative work, transfer to any third party, or in any way commercially exploit any UBS research provided via Global Research or otherwise, and that you shall not extract data from any research or estimates provided to you via Global Research or otherwise, without the prior written consent of UBS.

This document is for distribution only as may be permitted by law. It is not directed to, or intended for distribution to or use by, any person or entity who is a citizen or resident of or located in any locality, state, country or other jurisdiction where such distribution, publication, availability or use would be contrary to law or regulation or would subject UBS to any registration or licensing requirement within such jurisdiction. It is published solely for information purposes; it is not an advertisement nor is it a solicitation or an offer to buy or sell any financial instruments or to participate in any particular trading strategy. No representation or warranty, either expressed or implied, is provided in relation to the accuracy, completeness or reliability of the information contained in this document ("the Information"), except with respect to Information concerning UBS. The Information is not intended to be a complete statement or summary of the securities, markets or developments referred to in the document. UBS does not undertake to update or keep current the Information. Any opinions expressed in this document may change without notice and may differ or be contrary to opinions expressed by other business areas or groups of UBS. Any statements contained in this report attributed to a third party represent UBS's interpretation of the data, information and/or opinions provided by that third party either publicly or through a subscription service, and such use and interpretation have not been reviewed by the third party.

Nothing in this document constitutes a representation that any investment strategy or recommendation is suitable or appropriate to an investor's individual circumstances or otherwise constitutes a personal recommendation. Investments involve risks, and investors should exercise prudence and their own judgement in making their investment decisions. The financial instruments described in the document may not be eligible for sale in all jurisdictions or to certain categories of investors. Options, derivative products and futures are not suitable for all investors, and trading in these instruments is considered risky. Mortgage and asset-backed securities may involve a high degree of risk and may be highly volatile in response to fluctuations in interest rates or other market conditions. Foreign currency rates of exchange may adversely affect the value, price or income of any security or related instrument referred to in the document. For investment advice, trade execution or other enquiries, clients should contact their local sales representative.

The value of any investment or income may go down as well as up, and investors may not get back the full (or any) amount invested. Past performance is not necessarily a guide to future performance. Neither UBS nor any of its directors, employees or agents accepts any liability for any loss (including investment loss) or damage arising out of the use of all or any of the Information.

Any prices stated in this document are for information purposes only and do not represent valuations for individual securities or other financial instruments. There is no representation that any transaction can or could have been effected at those prices, and any prices do not necessarily reflect UBS's internal books and records or theoretical model-based valuations and may be based on certain assumptions. Different assumptions by UBS or any other source may yield substantially different results.

This document and the Information are produced by UBS as part of its research function and are provided to you solely for general background information. UBS has no regard to the specific investment objectives, financial situation or particular needs of any specific recipient. In no circumstances may this document or any of the Information be used for any of the following purposes:

- (i) valuation or accounting purposes;
- (ii) to determine the amounts due or payable, the price or the value of any financial instrument or financial contract; or
- (iii) to measure the performance of any financial instrument.

By receiving this document and the Information you will be deemed to represent and warrant to UBS that you will not use this document or any of the Information for any of the above purposes or otherwise rely upon this document or any of the Information.

UBS has policies and procedures, which include, without limitation, independence policies and permanent information barriers, that are intended, and upon which UBS relies, to manage potential conflicts of interest and control the flow of information within divisions of UBS and among its subsidiaries, branches and affiliates. For further information on the ways in which UBS manages conflicts and maintains independence of its research products, historical performance information and certain additional disclosures concerning UBS research recommendations, please visit www.ubs.com/disclosures.

Research will initiate, update and cease coverage solely at the discretion of UBS Investment Bank Research Management, which will also have sole discretion on the timing and frequency of any published research product. The analysis contained in this document is based on numerous assumptions. All material information in relation to published research reports, such as valuation methodology, risk statements, underlying assumptions (including sensitivity analysis of those assumptions), ratings history etc. as required by the Market Abuse Regulation, can be found on NEO. Different assumptions could result in materially different results.

The analyst(s) responsible for the preparation of this document may interact with trading desk personnel, sales personnel and other parties for the purpose of gathering, applying and interpreting market information. UBS relies on information barriers to control the flow of information contained in one or more areas within UBS into other areas, units, groups or affiliates of UBS. The compensation of the analyst who prepared this document is determined exclusively by research management and senior management (not including investment banking). Analyst compensation is not based on investment banking revenues; however, compensation may relate to the revenues of UBS Investment Bank as a whole, of which investment banking, sales and trading are a part, and UBS's subsidiaries, branches and affiliates as a whole.

For financial instruments admitted to trading on an EU regulated market: UBS AG, its affiliates or subsidiaries (excluding UBS Securities LLC) acts as a market maker or liquidity provider (in accordance with the interpretation of these terms in the UK) in the financial instruments of the issuer save that where the activity of liquidity provider is carried out in accordance with the definition given to it by the laws and regulations of any other EU jurisdictions, such information is separately disclosed in this document. For financial instruments admitted to trading on a non-EU regulated market: UBS may act as a market maker save that where this activity is carried out in the US in accordance with the definition given to it by the relevant laws and regulations, such activity will be specifically disclosed in this document. UBS may have issued a warrant the value of which is based on one or more of the financial instruments referred to in the document. UBS and its affiliates and employees may have long or short positions, trade as principal and buy and sell in instruments or derivatives identified herein; such transactions or positions may be inconsistent with the opinions expressed in this document.
